

Tracking Outcomes at Helen Hayes Hospital: Traumatic Spinal Cord Injury

The most recent data obtained from ITHHealthTrack indicates that 98% of Spinal Cord patients surveyed are very satisfied with the services they received at Helen Hayes Hospital. 93% were able to manage their own health care maintenance after discharge.

% Discharged to Community Setting

For the most part, our discharge to home is on par with the region and the nation, except for 2013, which was the year we had the most severe cases of people who required intubation and a ventilator for breathing and most of those patients required further rehabilitation in a subacute rehab setting.

Percent of Responding Patients Residing in a Community Setting 90 Days Post Discharge

The above chart indicates that 90 days after discharge, among patients contacted, this percent of patients are living within a community setting. For two years in a row, HHH was on par with both the nation and region for patients still living in the home three months later, and in 2014 we were higher than both.

FIM Change (Admission to Follow-up)

Our functional gains using the Functional Independence Measure (FIM) tool are much higher than the nation and the region for three consecutive years.

Case Mix Index

The severity of the cases we see here at HHH are a little higher than both the nation and the region and in spite of that our functional outcomes are still higher: a statistic we are very proud of.

Rehab LOS in Days

At Helen Hayes Hospital, our average LOS is a bit longer than the nation and the region; however, our functional outcomes are better.
